

Marketing Web Guide

The additional visual and UX rules Claude Design needs for JOOR campaign and landing pages — the ground the core JOOR Design System doesn't cover, because it was built for the application, not the storefront.

Sits alongside the JOOR Design System — it does not replace or restate it. ·

Evidence: Home, Apparel vertical, Brands Overview, Google Ads campaign LP, Request a Demo, ROI Calculator, the Jan 2025 color/type palette, confirmed button-hover and FAQ screenshots, plus directly-supplied logo, header, hero, and stat reference screenshots.

· **Not evidence:** anything tagged Gap below — flagged rather than invented.

This guide covers only principles that would still apply if we were designing a completely different JOOR marketing page tomorrow. Everything specific to the network calculator campaign — its data, its page structure, its messaging — lives in the companion [Calculator Campaign Brief](#).

● **Confirmed pattern**

● **Inconsistency — avoid**

● **Gap — no evidence, decide fresh**

● **Component — defer to Design System**

📄 **On components specifically:** this guide was built from marketing-page references only — it does not review the JOOR Design System's existing application/UI components (cards, buttons, form controls, and similar). Where a topic below is a genuine marketing-web pattern — something visible in the reference screenshots, like which photography gets rounded corners or which color reads as the primary CTA — it's marked Confirmed. Where this guide instead proposes a component treatment (a card style, a button shape, an input control) without that support, it's marked **Component — defer to Design System**: Claude Design should pull the actual styling from the existing Design System rather than treat this guide's illustration as a new standard.

Visual direction: editorial, not application UI

Every marketing page reviewed reads as fashion-editorial rather than B2B SaaS: a serif display face for every headline and stat numeral, restrained neutral color, moody fashion photography, and generous whitespace. That's the throughline to protect — the marketing surface should feel like it belongs next to the brands JOOR represents, not like an extension of the order-management screens underneath it.

- Confirmed across all 8 references

Color & type — the materials

Taken directly from JOOR's Jan 2025 color/type palette. No color in the source document carries a name — only hex values, with three marked "primary."

#008BAD teal is not marked "primary" in the source deck, yet it is the one color used consistently as the interactive/CTA accent across every page reviewed — treat it as the functional primary accent regardless of the deck's own labeling.

- ① The Style Guide page names *Canela Thin* / *Canela Light* as the headline font, with *Antic Didone Bold* as the documented alternative. Both Canela cuts are now embedded directly in this guide, via the licensed trial webfont from Commercial Type. Antic Didone stays in the font stack as the fallback — both for the rare case the embedded file fails to load, and because the trial file's character set is limited (it's missing `&`, `:`, `;`, `(`, and `)`); the browser substitutes the fallback glyph automatically, character by character, so copy doesn't need to avoid them.

HEADLINE — THIN

Scale fashion wholesale

STAT NUMERAL —
LIGHT

14,000+

STAT CAPTION

BRANDS ON JOOR

SECTION SUPPORTING
TEXT

Sets up the section below — 24px, weight 500, wherever it appears, including the closing CTA band.

BODY — REGULAR

JOOR helps fashion brands and retailers connect, sell, buy, and manage wholesale in one platform.

BODY — SEMIBOLD

Used for bold lead-in phrases, labels, and buttons.

Canela ships as two real cuts, not one weight approximated two ways: **Thin (100)** for large display headlines — hero-scale H1s — and **Light (300)** for section headings and other secondary serif use (stat numerals, the sidebar wordmark, section numbers). Use the actual cut for the job rather than asking the browser to synthesize weight.

- ① **Resolved, previously a workaround:** earlier drafts of this guide asked the browser to synthesize a heavier weight out of Antic Didone's single 400 cut, which held up at section-heading scale but visibly thickened and lost its thin-serif character above ~70px. With real Canela Thin and Light files now embedded, that size threshold no longer applies — pick Thin or Light by role, not by a pixel cutoff.

Eyebrow / section kicker: a short uppercase label above a heading, naming the section. 14px, weight 500, letter-spacing 0.22em (0.28em on photographic grounds). Colour `#77848F` on light grounds; white at 60% opacity on dark. An earlier size of 10–11px/400 read as fine print rather than a label — don't go smaller than this.

Stat caption: the line beneath a stat numeral. 14px, weight 400, letter-spacing 0.08em, uppercase, colour `#40515D`. It sits at secondary-text weight but near-ink darkness — a lighter caption grey undersells the figure next to it.

Section supporting text — single spec: the sentence under a heading is 24px, weight 500, line-height 1.4 wherever it appears — hero, mid-page section, or closing CTA band. Do not scale it down in the closing band; a lighter treatment there breaks the ladder.

- Confirmed directly — decided during the calculator build

Logo

The standard-color JOOR wordmark is the default on a light or photographic-light ground. On a dark background — a photo with a scrim, a dark CTA band, the footer — switch to a white version of the same mark rather than leaving the standard-color version to fight the background.

The image shows the wordmark "JOOR" in a light grey, sans-serif font, centered within a light grey rounded rectangle.

Standard color — light or photographic-light grounds

The image shows the wordmark "JOOR" in a white, sans-serif font, centered within a dark grey rounded rectangle.

White version — dark grounds

- Confirmed directly — standard-color mark supplied; dark-ground rule stated directly

► **Note:** only the standard-color logo file was supplied. The white version above is produced by converting that file to solid white for this guide — it reads cleanly because the supplied mark is effectively single-color on a transparent ground, but Claude Design should use an actual white-export asset if one exists rather than rely on this filter treatment in production.

Recurring copy pattern

Feature bullets consistently open with a bold lead-in phrase, then continue in regular weight within the same sentence — worth carrying forward as-is.

- **Search the network to discover new retailers** — from independent boutiques to global department stores.
- **Manage orders in real time** — from first sample request through to reorder.

- ① **Em dash usage — general rule:** minimize em dashes in headlines, subheads, and CTA copy. Overused as a generic connector, it reads as boilerplate or AI-generated rather than deliberate. **Explicit exception:** the bold lead-in bullet pattern above — a bold phrase followed by a continuation in regular weight — uses an em dash structurally and is confirmed evidence-based (seen on Home, Apparel, Brands Overview, Demo Request). That pattern stays exactly as documented; this new guidance targets freeform prose outside that specific bullet convention, not the convention itself.

Hero composition

The hero's format is authoritative, not inferred: a left-aligned serif H1 (two to three lines) with a sans-serif subhead directly beneath it, and one or two CTAs below that — all set against a photographic ground. Hero height is not a fixed value; it's driven by however much content the headline and subhead actually need, with generous open space held above and below that text block rather than the copy running edge-to-edge.

Reference — supplied as the authoritative hero format.

- Confirmed directly — reference screenshot supplied as the standard

Two accepted compositions

Both variants keep the H1 left, and both are built from assets JOOR supplies — the background photograph, and any right-side visual. Claude Design should never source or generate either.

VARIANT A

A stock/lifestyle photograph fills the hero background, with a separate visual element — a UI mockup, an illustration, a graphic — placed on the right, layered on top of it.

VARIANT B

A stock photograph that already carries its own right-side visual moment — no separate element is composited on top; the photography itself resolves the right side of the composition.

- **Confirmed — both variants stated directly, not inferred from references**

▮ **Legitimate exception:** the Request a Demo page uses a pure typographic hero — no photography at all, headline and bullets beside the form on plain white. Read this as the correct pattern for a form-first, conversion-only hero, not a mistake to correct.

Imagery: three registers, one cropping rule

Three kinds of image recur, often combined on the same page: **editorial fashion/runway photography** for hero and closing-CTA moments (moody, shallow depth of field), **styled lifestyle photography** for feature sections, and **simplified product-UI mockups** layered on top of photography as a floating white card — the one deliberate bridge between marketing imagery and the actual product.

Cropping

Photography is cropped hard-edged and rectangular everywhere — no rounded corners were observed on a single photograph across any reference. Rounded corners and drop shadows are reserved for the floating UI-mockup cards. Keep that distinction: **photography stays sharp-edged; only app-like UI chrome gets softened.**

Photography — hard edge, no shadow

- **Confirmed on Home, Apparel, Brands Overview**

19,200

Order total — UI-mockup card, rounded + shadowed

The rounded/shadowed treatment shown here describes how UI mockups are *photographed within marketing imagery* — it's not a proposed live component. Any functional card actually built for a page should still use the Design System's real card component.

- **Avoid:** color grading is not unified within a single page — a cool desaturated hero next to a saturated studio case-study photo next to a warm-toned closing band, sometimes on the same scroll. Pick one grade per page (or per page section family) rather than letting each image keep its source campaign's own treatment.

Dark-photo scrim range

Where copy sits over photography, scrim opacity runs 0.20–0.40 black-ink (#2D3439), as a gradient rather than a flat tint, with the heavier stop sitting behind the text. Above 0.40 the photograph stops reading as photography; below 0.20, don't assume contrast holds — check white copy against the image's lightest region.

SCRIM RANGE — GRADIENT, HEAVIER STOP BEHIND TEXT

Scale Fashion Wholesale

- Confirmed — decided during the calculator build

Cropping and subject placement

Crop the hero asset itself rather than relying on CSS `object-fit` — a browser-side crop shifts with the viewport and can move the subject under the headline. Keep the subject in the outer 60–75% of the frame, clear of the left-aligned H1 block. Where a supplied asset doesn't allow that, request a re-crop rather than reframing on the page.

- Confirmed — decided during the calculator build

Typical page skeleton

Home, Apparel, and Brands Overview all follow close to the same scroll order:

Full site pages run long — 11 to 17 sections. That's appropriate for pages whose job is to explain the whole platform. It is **not** the model for a focused campaign landing page — see Part Two.

- Confirmed on Home, Apparel, Brands Overview

Page width, whitespace & rhythm

▮ **Gap, resolved by direction:** the reference files are PDF exports of live pages, so exact pixel spacing isn't reliable evidence. Per direction, the values below are a reasonable industry-standard starting point — not measured from JOOR's site — for Claude Design to refine during build.

- **Max content width:** ~1280px for full-bleed sections; ~720–760px for a single reading column of prose.
 - **Spacing scale:** 8 / 16 / 24 / 32 / 48 / 64 / 96 / 128px.
 - **Section rhythm:** 64–96px of vertical padding between major sections.
 - **Section separation:** alternate white and a tint band (#F9F9F9 or #EBEDF0) as the primary separator, rather than the thin divider rules seen inconsistently across references — pick one convention and hold it.
- ① **Overlapping-panel rhythm — measured, not generic:** where a panel overlaps the hero band (the tool-over-hero composition described in Sections 03 and 10), the hero needs ~150px of open space above the H1 and ~270px below the subhead so the panel doesn't crowd the copy. The section immediately below an overlapping panel takes ~88px, not the standard 96–128px above — the panel's own padding already supplies visual separation, and a full section gap opens a dead band underneath it.

• **Confirmed — measured directly from the calculator build**

Presentation of statistics

A large serif numeral over a short one- or two-line caption — typography alone carries the weight, never an icon. Which container treatment it gets depends on where it sits on the page, and both treatments below are directly confirmed rather than inferred.

Free-standing — dedicated stat section

When statistics get their own section on the page, they stay free-standing: no card, border, or block around each number — just enough gap between them that they read as separate figures rather than crowding together.

FREE-STANDING — AS OBSERVED

700,000+

Global retail buyers

2.5M+

New connections made

Reference — free-standing treatment.

- Confirmed on Home, Apparel, Brands Overview, Google Ads LP

Even columns: free-standing stats sit in equal-width columns, with each figure and caption centred within its column. Cap the numeral's size so no figure can exceed its column — the widest figure in the row (e.g. 700,000+) sets the ceiling. A numeral sized to the viewport rather than to its column collides with its neighbour and the row reads as misaligned.

- Confirmed — decided during the calculator build

Tiled — hero or overlay context

When the same kind of stat instead sits inside a hero, or overlays on top of another section, each one moves into its own separate tile/block — the container earns its keep there because the stat is competing with a busier background rather than sitting on open space.

Reference — tiled treatment.

- **Confirmed directly — reference screenshot supplied as the standard**

☐ **Defer to the Design System:** the tile's exact radius value, shadow, and padding above are illustrative only — pull the actual container styling from the Design System's card/tile component. What is confirmed directly is that these tiles round at all: they're the one deliberate exception to the sharp-corner rule in Section 08 — stat tiles round, everything else defaults to sharp.

- 🚩 **Avoid:** the same claim stated with different numbers across pages (one reference showed 675K, 600,000, and 650K buyers for what reads as the same figure). Any stat introduced on a new page must be single-sourced and consistent everywhere it repeats.

Cards & content containers

The genuine marketing-web pattern here is about **editorial content, not components**: case-study photography, blog imagery, and feature visuals consistently sit directly on the page with no border, shadow, or container — they're treated as content, not as UI. Keep that: editorial imagery should stay card-less and hard-edged rather than getting wrapped in a component-style container.

- Confirmed on Home, Apparel, Brands Overview

Corner radius, generally

Buttons, inputs, and interactive controls default to sharp, unrounded corners — that stays the rule, and it isn't deferred. Three exceptions round: the call-out stat tiles (Section 07); images used within a portion of a section rather than as a full-bleed background; and widget or panel containers — a calculator shell, a results panel, an image card — which take the Design System's medium radius. The distinction is functional, not decorative: anything you click stays sharp, anything that holds content is allowed to soften.

- Confirmed directly — corner-radius rule refined during the calculator build

- ☐ **Defer to the Design System:** beyond that editorial-content pattern, there's no consistent marketing-specific card system to document — the existing ROI Calculator's panels, the floating UI-mockup overlays, and various content cards across pages all use different, unreviewed treatments. Rather than propose a new card component here, any container needed for an interactive or app-adjacent element (an input panel, a results card, a UI-mockup frame) should pull its shape, elevation, and radius from JOOR's existing Design System component, not from an invented spec in this guide.

CTA system

What's genuinely confirmed from the references is a **color and copy pattern**, not a button component: **#008BAD teal reads as the primary action color** everywhere it appears consistently, white-outline reads as secondary, and plain text-with-arrow reads as tertiary/in-card navigation. The clearest, most repeated inconsistency across every reference is that this color logic isn't held consistently — navy-fill and a washed-out slate-gray fill also appear as ostensibly primary actions, sometimes on the same page as the teal version.

- **Color/hierarchy pattern confirmed across references**

Corner treatment is confirmed directly, not inferred: buttons use sharp, unrounded corners — see the corner-radius rule in Section 08.

- **Confirmed directly — sharp corners stated explicitly**

CORNERS CONFIRMED SHARP — PADDING AND SIZING BELOW ARE ILLUSTRATIVE ONLY

Request a Demo

Find Out More

Primary — teal fill, hover to lighter teal

Secondary — outline, no distinct hover confirmed

Explore Now →

Tertiary — text link, in-card navigation

Hover the primary button above — that lighter-teal shift is the only confirmed hover treatment; it applies to the solid teal fill only.

- ☐ **Defer to the Design System:** the button shapes above illustrate the color/hierarchy pattern and the sharp-corner rule only. Padding, sizing, and the secondary button's hover state (unconfirmed here) should come from JOOR's existing button component rather than be redefined by this guide — if the Design System's button component differs from what's shown, the Design System wins on everything except the corner-radius rule above.

Placement

Primary CTA directly under the hero subhead; a repeated CTA after most major sections; one final full-bleed dark-photo CTA band before the footer. Keep that rhythm — but watch the count: the existing ROI Calculator repeats "Request a Demo" or "Calculate" six-plus times including a persistent chat bubble, which dilutes rather than focuses attention.

- **Avoid: CTA color drift and CTA proliferation — both independently confirmed across references**

Hero CTA and interactive tools: where a page's primary interaction is a tool positioned in or directly below the hero, the tool is the hero's call to action — omit a separate hero CTA rather than competing with it. A tertiary text-with-arrow link pointing at the tool is also unnecessary once the tool is already visible on load.

- **Confirmed — decided during the calculator build**

Header button sizing

Marketing-page header actions run larger than the application default — roughly 47px tall, with the label scaled proportionally. The application's 32–37px control height reads as app chrome once it's sitting in a marketing header.

- **Confirmed — decided during the calculator build**

Interactive tools & calculators

None of JOOR's marketing pages had done this well before the network calculator, so this section started with no confirmed marketing-web pattern. Building and refining that calculator has since settled concrete decisions for the pattern, listed below — content strategy and interaction model, not final component styling, which still pulls from the Design System where one exists.

Content & interaction-model guidance

- Where the interaction is simple (a small, fixed set of options), prefer updating results live over requiring a separate "Calculate" step — a content/UX decision, not a styling one.
- Keep CTA discipline near any tool: one clear action, not several competing for attention — consistent with the CTA-proliferation issue already confirmed elsewhere in this guide.
- Present each distinct result as what it actually is (a proportion, a count, a rate) rather than flattening every metric into identical-looking output — this is about information design, not a specific component.

Selector controls

Where the option set is small and fixed (eight or fewer), show every option at once as sharp-cornered pill buttons rather than a dropdown — a dropdown hides the range of the tool, which is itself part of the message. Selected state: filled with ink (#323E48), white label.

- Confirmed — decided during the calculator build

Result grouping

Group results by type within one shared panel with a single internal division, not as twin disconnected cards: proportional data in one rail (an arc, or a stacked bar with a labelled legend), discrete metrics in a grid alongside it.

- Confirmed — decided during the calculator build

Deep-linking

A tool driven by a single selection should read and write back a URL parameter for that selection, so outbound and paid traffic can land on a pre-selected state that looks identical to a manual selection.

- Confirmed — decided during the calculator build

Incomplete data

Where the option set is broader than the data available, keep the option visible rather than hiding it or showing an empty or zero result — show an explicit "data coming soon" state that names the option and routes to the demo CTA.

- Confirmed — decided during the calculator build

CTA responsiveness to selection state

CTA copy tied to an interactive tool should react to the tool's current selection state. This applies to every CTA connected to that tool, not just the one sitting closest to the results — a second or repeated CTA elsewhere on the page should stay in sync with the same selection, not lag behind it with static copy.

- Confirmed — decided during the calculator build

Mobile adaptation

The two patterns above are desktop patterns, not absolute rules — both adapt on mobile:

- **Selector:** the "show every option at once" pill/segmented control described above is a desktop pattern. On mobile, collapse it into a dropdown or tab control to preserve space.
- **Results:** the single grouped results panel described above is also a desktop pattern. On mobile, present each individual stat or graph as its own standalone tile in a horizontal scroll carousel — one tile per screen, swipeable — with small dots at the bottom indicating tile count and which tile is active.

- Confirmed — decided during the calculator build

☐ **Defer to the Design System:** exact padding, spacing, icon styles, and chart-rendering detail should still come from JOOR's existing Design System component library where one exists. What's now confirmed directly — from building and refining the calculator itself — is the higher-

level pattern above: pills over dropdowns, one grouped results panel, deep-linkable state, and an explicit incomplete-data treatment. If the Design System's own component differs in detail, reconcile against it, but don't drop the pattern.

11

FAQ & accordion pattern

A simple single-column accordion: chevron rotates on open, the answer (including inline underlined links) appears directly below the question, and the open question's text shifts to a heavier, darker weight against its still-light-gray collapsed siblings.

FAQ — LIVE DEMO, MATCHES CONFIRMED SCREENSHOTS

How does JOOR help apparel brands connect with verified global retailers?

JOOR gives apparel brands access to a global network of verified retailers through a secure, centralized wholesale platform. Using [JOOR Discover](#), our wholesale marketplace, you can build trusted partnerships with buyers in key markets worldwide.

Can apparel brands use JOOR to streamline order management, payments, and buyer communications? 

• Confirmed via screenshots — single-open accordion, chevron rotate, weight shift on open

Header & footer treatment

Every new landing page uses the same header shell as joor.com — same logo placement, same layout and sizing — but stripped of navigation by default. No nav dropdowns and no Pricing link unless a specific campaign calls for them and supplies the exact links to use; the standard template ships with only two actions on the right, **Request a Demo** and **Open a Buyer Account**, and no Login link.

Reference — the header shell to reuse.

STANDARD HEADER — NO NAV ITEMS, TWO ACTIONS ONLY

JOOR

Request a Demo

Open a Buyer Account

- Confirmed directly — stated as the standard template, not inferred

- ▮ **Per-campaign exception:** nav items are added back only when a specific campaign brief explicitly requests them and supplies the links to use — never by default, and never invented for a page that wasn't given any.

Header dimensions

The standard marketing header is 90px tall, with the logotype at 55px and a 1px bottom rule (no border box, no rounding — see the corner-radius rule in Section 08), inside the same ~1280px content width used everywhere else in this guide. That's noticeably taller than the application header; the extra height is what separates the marketing shell from app chrome.

- Confirmed — measured directly from the calculator build

The dark-ground logo rule in Section 02 still applies here: only the standard-color logo file has been supplied, so a true white export should be added to the asset set rather than relying indefinitely on the filter-derived version.

Campaign footer

Footer treatment follows the same page-type logic seen across the reference set: full site pages carry the complete five-column dark footer, while a paid-traffic or campaign-specific landing page can reasonably strip it back. The condensed campaign footer is left-aligned logotype and tagline, right-aligned copyright and privacy link, roughly 100px tall. Confirm the footer per page against the header decision above rather than defaulting to the full version.

- Confirmed on Home, Apparel, Brands Overview, Request a Demo, ROI Calculator, Google Ads LP

► **Avoid:** a centred condensed footer was tested and reverted during the calculator build — centring reads as a full-site footer treatment, not a campaign one. Keep the condensed footer left/right, not centred.

Responsive & mobile

None of the references include a mobile or tablet capture, so most responsive behavior is still handled adaptively during the Claude Design build and refined through testing rather than specified in advance. The calculator build has since produced two concrete decisions, carried over from Section 10's interactive-tools guidance:

- **Selector controls** collapse from the desktop pill/segmented control (every option visible at once) into a dropdown or tab control on mobile, to preserve space.
- **Grouped results** become, on mobile, a horizontal scroll carousel of standalone tiles — one stat or graph per tile, swipeable — with small dots at the bottom showing tile count and the active tile.

• **Confirmed — decided during the calculator build**

Everything else on this page — general layout reflow, type scaling, spacing — remains deliberately unspecified and left to adaptive judgment during the build.

How marketing should feel different from the app

The application design system exists to make dense, functional data usable. Marketing's job is the opposite: sell the feeling of the brand before the product's mechanics matter. Lean into what's already consistent — serif display type, moody photography, quiet neutral-plus-teal color — rather than importing the app's UI language wholesale. Where the two need to meet (proving the product actually does what the copy claims), use the floating UI-mockup card as the one deliberate bridge, not a full dense screenshot.

Patterns to avoid

PATTERN	FIX
CTA color drift — teal, navy, and washed-out slate-gray all used as "primary"	Hold teal as the one primary CTA color; pull exact button styling from the Design System's button component
CTA proliferation — up to 6+ instances of overlapping actions on one page	One clear CTA near any single tool or offer; repeat sparingly, not per section
Inconsistent photo color-grading within one page	One grade per page or section family
Lowest-contrast styling on the highest-intent button (e.g. a muted gray "Calculate" or form submit)	The button carrying the most intent gets the most confident treatment, not the least — using whichever button variant the Design System defines as primary
Generic native <code><select></code> dropdowns for a flagship interactive element	Replace with a styled control from the Design System's component set, not a new one invented for this page
Twin, disconnected input/output cards presented as "one tool"	Compose input and output as one visual instrument using the Design System's existing container components
Vertical/template leakage — a shared template leaking one vertical's copy into another (an "accessories" caption on the Apparel page; a live "Covert" typo)	QA every dynamically-swapped string per variant, not just once visually

PATTERN	FIX
Same stat quoted with different numbers across pages	Single-source every figure; never restate from memory
Rounded corners applied broadly to buttons and UI elements	Default to sharp corners everywhere; round only stat tiles, in-section images, and widget/panel containers, per Section 08
Eyebrow labels set at fine-print size (10–11px/400)	14px/500 — a label, not a caption
Synthesized heavy serif at display size	Weight 400 above 70px
Photographic crop delegated to CSS <code>object-fit</code>	Crop the asset; keep the subject clear of the copy block
Numerals sized to viewport width rather than their column	Cap to the widest figure in the row
Full section padding below an overlapping panel	~88px — the panel's own padding is part of the gap
Application control heights in a marketing header	90px header, ~47px actions, 55px logo

Applying this to a specific campaign

This guide stops at principles that hold for any JOOR marketing page. For a specific build — data, page structure, messaging, and launch decisions — see the companion [Network Calculator Campaign Brief](#), which applies these principles to the outbound campaign's calculator landing page currently in progress.

Prepared for Arnu, Joor Access LLC — reference for Claude Design alongside the JOOR Design System. Built from the supplied reference PDFs, button/FAQ screenshots, and the logo/header/hero/stat reference screenshots; tagged findings distinguish confirmed pattern, inconsistency, gap, and defer-to-Design-System throughout.
