

Network Calculator Campaign Brief

Everything specific to the outbound campaign's landing page: the calculator's real data and logic, how this page should differ from the existing ROI Calculator, and the page-structure, chrome, and QA decisions for this build.

Read alongside the **Marketing Web Guide** — apply its reusable principles here; this brief covers only what's specific to this campaign.

.

Sources: the calculator functional spec (verbatim data below), the ROI Calculator page, the Google Ads campaign LP, and decisions made in review.

- 🚩 **Out of scope for this artifact:** hero copy, CTA copy and CTA logic, feature-bullet content, stat-description wording, and the "retailers with orders in the last 12 months" dataset. This brief covers only the calculator widget itself — category data, logic, formatting rules, and the calculator's own mobile behavior. Anything page-level belongs in the page-update request, not here; don't let it drift back in.

Calculator data & logic

The **JOOR Vertical Snapshot Calculator**: a visitor selects one of six industry verticals and the page instantly shows JOOR network stats for it — no submit button, no calculation delay. Six data points per vertical: NA / EMEA / APAC reach (always sums to 100 — a natural fit for one proportional visual rather than three separate numbers), retailers connected last year, re-order rate, and two metrics that switch format by vertical.

■ **Standing rule — six categories, no exceptions:** the calculator's live category set is exactly these six: Apparel, Footwear, Accessories, Swimwear & Resort, Children's Wear, Bridal. Sports & Outdoor and Home & Design are removed from scope entirely — not paused, not "coming soon" (decided in [Section 07](#)). No additional category should ever be added to the calculator by inference from an unrelated data source — for example, a different report that happens to use category names like "Shoes," "Outerwear," or "Home." Any such data lives outside this artifact and outside the calculator's scope unless a category is explicitly added back through this brief.

VERTICAL	NA%	EMEA%	APAC%	RETAILERS CONNECTED	RE-ORDER %	BRAND-PROFILE METRIC	LINESHEET METRIC
Apparel	42	46	12	124,000	58	YoY +16%	YoY +38%
Footwear	40	47	13	70,000	52	YoY +26%	YoY +51%
Accessories	38	49	13	92,000	47	YoY +21%	YoY +52%
Swimwear & Resort	46	40	14	38,000	47	YoY +53%	YoY +77%
Children's Wear	47	41	12	50,000	54	60,000 profiles viewed	120,000 linesheets viewed
Bridal	38	50	12	130,000	61	150,000 profiles viewed*	170,000 linesheets viewed*

*Bridal's brand-profile/linesheet metrics are labeled "women's wear," per the spec — not "bridal wear."

Formatting & label logic

- metricType: "yoy" (Apparel, Footwear, Accessories, Swimwear & Resort) → signed percentage, e.g. +16% .

- `metricType: "count"` (Children's Wear, Bridal) → plain thousands-separated number, e.g. `60,000` .
- `retailersConnected` is always a thousands-separated count, never a %.
- Re-order rate's label must read **"Re-order rate from retailers buying {vertical} brands"**, substituting the real `reorderNoun` per vertical (e.g. "retailers buying footwear brands") — never one hardcoded industry name across all six.
- Selecting a different vertical updates all stats immediately — this is a live instrument, not a form with a calculate step.
- URL deep-linking (`?vertical=footwear`) is a real, if optional, requirement — the page should support landing pre-selected into any vertical.
- Every result stat (region breakdown, retailers connected, re-order rate, brand-profile metric, linesheet metric) needs an explanatory description beyond its numeral and short label — a line saying what the stat actually represents, substituted per category the same way the re-order rate label substitutes `{vertical}` . The exact wording is page copy and belongs in the page-update request, not here; recorded as a requirement only, so it isn't silently dropped in a future build.

① The original functional spec defined eight verticals (an earlier version of that spec even referenced "9 total," though only 8 were ever listed). Two of those eight — Sports & Outdoor and Home & Design — have since been removed from scope entirely, bringing the live set to the six above. Carrying the "9 total" discrepancy forward here only as spec history, not as something to design around.

Mobile behavior — calculator only

Scoped strictly to how the calculator widget itself adapts on small screens — not the page's general responsive behavior, which is handled adaptively during the build per [Section 07](#).

- **Category selector:** desktop keeps the pill/segmented control (per the Marketing Web Guide's selector-control rule — every option visible at once). On mobile only, this collapses into a dropdown/tab selector.
- **Results:** on mobile, each result stat becomes its own standalone tile in a horizontal scroll carousel — one stat per screen, swipeable — with a row of small dots at the bottom showing tile count and which tile is active.

① This is the calculator's specific application of the mobile stat-carousel pattern documented generally in the Marketing Web Guide (Section 10, Interactive tools & calculators) — see that section for the pattern's full rationale. Recorded here only as it applies to this widget, not as a restatement of the general rule.

Deliberately not the existing ROI Calculator

The ROI Calculator is JOOR's closest existing precedent, and per direction it is **not** a visual reference for this build — this calculator is the centerpiece of the whole campaign and needs to read as materially more interactive.

ROI CALCULATOR, AS BUILT

- Two native `<select>` dropdowns, no custom styling
- Requires a "Calculate ROI Now" click — no live update
- Input and results are twin, disconnected cards with identical generic chrome
- Results are four identical flat gray tiles — no icons, no chart, no visual differentiation by metric type
- Six-plus competing CTA instances across the page, including a persistent chat bubble

THIS CALCULATOR

- Custom, scannable vertical selector — all 6 options visible at once (pills, tiles, or a segmented control), matching the spec's "all selectable at all times" requirement
- Updates live on selection — no calculate step, matching the spec directly
- Input and results fused into one visual instrument, not two separate cards
- NA/EMEA/APAC as one proportional bar; retailers-connected, re-order rate, and the two vertical-dependent metrics each get distinct visual treatment
- One disciplined "Request a Demo" CTA beside the results, repeated once more at page end

Page structure — applying the Guide to this hypothesis

Working hypothesis: *Hero* → *calculator and results* → *primary demo CTA* → *concise platform/value section* → *network scale statistics* → *client logos/social proof* → *final demo CTA*. This is already leaner than any full JOOR marketing page reviewed. Refinements, applying the Marketing Web Guide's general principles to this specific page:

- **Keep the hero minimal.** The calculator is the offer here, not the hero — so skip the long-bullet-list-plus-photo-collage pattern the Guide documents as standard, and use its "form/tool-first" hero variant instead: a short headline and one supporting line, calculator visible at or just below the fold.
- **Merge logos into the stats/proof section** rather than running them as a separate block — keeps the post-calculator content to two tight sections (platform/value, then stats-and-proof together) instead of three.
- **Keep the platform/value section to one concise pass** — not a repeated alternating feature-block pattern. This page has already spent its attention budget on the calculator.
- **No FAQ or testimonials** — consistent with the goal of staying focused; the Request a Demo page this funnels into already carries its own testimonials.

Header & footer for this page

Per the Guide's general principle — full site chrome for on-site pages, stripped chrome for outbound-campaign destinations — this page should follow the stripped treatment: logo-only header (no nav dropdowns), footer reduced to logo, one-line tagline, and copyright/privacy. This page is reached from outbound sequences, not site navigation, so keeping it focused matters more here than consistency with the full-chrome norm used elsewhere on joor.com.

Per-vertical QA checklist

One template renders all six verticals by substituting labels and formats. Check each of these individually before launch — not just the first one that happens to look right.

Apparel reorderNoun apparel metricType yoy	Footwear reorderNoun footwear metricType yoy	Accessories reorderNoun accessories metricType yoy
Swimwear & Resort reorderNoun swimwear & resort metricType yoy	Children's Wear reorderNoun children's wear metricType count	Bridal reorderNoun bridal metricTypecount — labeled "women's wear"

This is exactly the failure mode the Guide flags from JOOR's own reference material (a shared template leaking one vertical's copy into another) — verify per vertical, not by spot-checking one and assuming the rest hold.

Decisions locked so far

- ✓ **Deep-linked landing state:** a visitor arriving via `?vertical=footwear` renders identically to one who just clicked "Footwear" manually — no separate "just for you" treatment.
- ✓ **Sports & Outdoor / Home & Design removed:** both cut from scope entirely rather than shown with a "data coming soon" placeholder — the calculator now covers six verticals, not eight. If a vertical without data is ever added back, the Marketing Web Guide's incomplete-data pattern (Section 10) still applies.
- ✓ **Headline font:** Canela (Thin for display, Light for section headings) is now embedded and live in the Marketing Web Guide. Antic Didone remains in the stack only as the automatic fallback for a handful of characters the current trial file's glyph set doesn't include.
- ✓ **Spacing & grid:** industry-standard values, not measured from the PDF exports — refine in build.
- ✓ **Responsive/mobile, page-level:** handled adaptively during the Claude Design build and refined through testing. The calculator widget's own mobile behavior — selector collapsing to a dropdown/tab, results becoming a swipeable tile carousel — is specified explicitly in [Section 02](#), not left to adaptive judgment.

Still open

No reference in the material reviewed shows a populated calculator results state — the only calculator capture available (the ROI Calculator) was seen empty, pre-calculation. The actual visual treatment of live numbers, the NA/EMEA/APAC bar, and per-metric icons is new design territory for Claude Design to originate, not something to match against a prior JOOR example.

- Open — genuinely new design territory
